Each category was evaluated on the basis of condition and performance, capacity vs. need, and funding vs. need.

A = Exceptional  
B = Good  
C = Mediocre  
D = Poor  
F = Failing  
I = Incomplete

America’s Infrastructure GPA  

Total Investment Needs  $1.6 Trillion

Estimated 5-year need  
(does not include security investment needs)
The Bush administration has proposed a further 33% reduction, to $730 million, for FY06.

America faces a shortfall of $11 billion annually to replace aging facilities and comply with safe drinking water regulations. Federal funding for drinking water in 2005 remained level at $850 million, less than 10% of the total national requirement. The Bush administration has proposed the same level of funding for FY06.

Between 2000 and 2003, the percentage of the nation’s 590,750 bridges rated structurally deficient or functionally obsolete decreased slightly from 28.5% to 27.1%. However, it will cost $9.4 billion a year for 20 years to eliminate all bridge deficiencies. Long-term underinvestment is compounded by the lack of a Federal transportation program.

Since 1998, the number of unsafe dams has risen by 33% to more than 3,500. While federally owned dams are in good condition, and there have been modest gains in repair, the number of dams identified as unsafe is increasing at a faster rate than those being repaired. $10.1 billion is needed over the next 12 years to address all critical non-federal dams—dams which pose a direct risk to human life should they fail.

The nation’s operating municipal landfills are declining in total numbers, but capacity has remained steady due to the construction of numerous regional landfills. In 2002, the United States produced 369 million tons of solid waste of all types. Only about a quarter of that total was recycled or recovered.

Gridlock on America’s runways eased from crisis levels earlier in the decade due to reduced demand and recent modest funding increases. However, air travel and travel have reportedly surpassed pre-Sept. 11 levels and are projected to grow 4.3% annually through 2015. Airports will face the challenge of accommodating increasing numbers of regional jets and new super-jumbo jets.

A single barge traveling the nation’s waterways can move the same amount of cargo as 58 semi-trucks at one-tenth the cost—reducing highway congestion and saving money. Of the 257 locks on the more than 12,000 miles of inland waterways operated by the U.S. Army Corps of Engineers, nearly 50% are functionally obsolete. By 2020, that number will increase to 80%. The cost to replace the present system of locks is more than $125 billion.

The U.S. power transmission system is in urgent need of modernization. Growth in electricity demand and investment in new power plants has not been matched by investment in new transmission facilities. Maintenance expenditures have decreased 1% per year since 1992. Existing transmission facilities were not designed for the current demand, resulting in increased bottlenecks which elevate the risk of blackouts.

The nation's operating municipal landfills are declining in total numbers, but capacity has remained steady due to the construction of numerous regional landfills. In 2002, the United States produced 369 million tons of solid waste of all types. Only about a quarter of that total was recycled or recovered.

While the security of our nation's critical infrastructure has improved since Sept. 11, the information needed to accurately assess its status is not readily available to engineering professionals. This information is needed to better design, build and operate the nation's critical infrastructure in more secure ways. Security performance standards, measures and indices need to be developed, and funding must be focused on all critical infrastructure sectors, beyond aviation.

The nation's operating municipal landfills are declining in total numbers, but capacity has remained steady due to the construction of numerous regional landfills. In 2002, the United States produced 369 million tons of solid waste of all types. Only about a quarter of that total was recycled or recovered.

The Bush administration has proposed a further 33% reduction, to $730 million, for FY06.

The EPA estimates that the nation must invest $390 billion over the next 20 years to replace existing systems and build new ones to meet increasing demands. Yet, in 2005, Congress cut funding for wastewater management for the first time in eight years.

Many of our nation’s public parks, beaches and recreational harbors, which were constructed more than 50 years ago, are falling into disrepair. These facilities are anchors for tourism and economic development and often provide the public’s only access to the country’s historic and natural resources. The National Park Service estimates a maintenance backlog of $6.1 billion for their facilities. Additionally, there is great need for maintenance, replacement and construction of new infrastructure in the state and municipal park systems.

The Federal government has not assessed the condition of America’s schools since 1999, when it estimated that $127 billion was needed to bring facilities to good condition. Other sources have since reported a need as high as $268 billion. Despite public support of bond initiatives to provide funding for school facilities, without a clear understanding of the need, it is uncertain whether schools can meet increasing enrollment demands and the smaller class sizes mandated by the No Child Left Behind Act.

“Investing in our infrastructure would definitely create jobs and would immediately stimulate the economy, and the investment would be lasting.”

CNN’s Lou Dobbs
U.S. News and World Report, May 19, 2003
