Rail

\$27 billion in improvements in one year by the freight railroads

In the 2013 report card, this chapter included commuter rail, which is included in the 'Transit' chapter in this report card.

OVERVIEW

For more than 150 years the rail network has been a critical component of the U.S. transportation system and economy. Today it carries approximately one-third of U.S. exports and delivers five million tons of freight and approximately 85,000 passengers each day. The private freight rail industry owns the vast majority of the nation's rail infrastructure, and continues to make significant capital investment — \$27.1 billion in 2015 — to ensure the network's good condition. U.S. rail still faces clear challenges, most notably in passenger rail, which faces the dual problems of aging infrastructure and insufficient funding.

CAPACITY & CONDITION

The U.S. rail network is comprised of nearly 140,000 miles of track and over 100,000 bridges. The system can be divided into two categories: private freight railroads and intercity passenger rail, operated almost exclusively by Amtrak.

FREIGHT RAIL

U.S. freight railroads are categorized into three classes based on the distance served and earnings: seven large Class I railroads, 21 regional/Class II railroads, and 547 short line/Class III railroads. In 2015, U.S. freight railroad volume was nearly twice what it was in 1980, even though the network's overall reach has declined. Class I railroads shed nearly 30% of their rail miles between 1990 and 2013, with many portions becoming short lines or abandoned. As of 2013, Class I railroads operated approximately 95,000 rail miles, regional railroads operated approximately 10,000 miles, and short line railroads operated approximately 33,000 miles. Capacity across the Class I network today is generally sufficient to meet current needs, but demand for rail is expected to grow as road congestion and demand for goods continue to increase. Recently, the Class I railroads have increased carrying capacity through the operation of double stack containers and heavier carloads.

2017 INFRASTRUCTURE REPORT CARD

Freight railroads, as owners of the infrastructure, are responsible for the condition of the majority of the nation's track, bridges, and connections at ports and intermodal facilities, and proactively maintain, replace, and upgrade systems through maintenance and capital programs. Changes in freight cargo trends in recent years have necessitated changes in the network. Coal, the most commonly transported bulk product by rail, has experienced a decline, while intermodal traffic has experienced substantial growth, requiring investment in connections to ports and truck transfer facilities. Freight railroads continue to upgrade their networks to support additional demand with greater capacity, added efficiency, and improved safety. This has required the rebuilding of bridges, tunnels, track, and signal systems.

Federal forecasts predict an approximately 40% increase in U.S. freight shipments, including by rail, by 2040. To prepare for the future, the U.S. Department of Transportation worked with the transportation industry to draft the first *National Freight Strategic Plan*, to address impediments to the efficient flow of goods in support of the nation's economy. The Fixing America's Surface Transportation (FAST) Act requires the strategic plan be completed by 2017 and be updated every five years.

PASSENGER RAIL

Amtrak operates a 21,356-mile network in over 500 communities, which served 31.3 million passengers in 2016. The system can be divided into two categories: the Northeast Corridor (NEC), running from Boston to Washington, D.C., and the "national network" of 15 interstate routes. Amtrak owns and operates the majority of the NEC's track—363 out of 457 miles—as well as 260 miles of track outside the NEC, including 18 tunnels and 1,414 bridges. Eight commuter railroads and four freight railroads operate on the NEC. (*For more information on commuter rail, see the Transit chapter.*) More than 90% of Amtrak's network, and almost all of the "national network," runs on tracks owned by freight railroads and, to a lesser extent, commuter railroads, and Amtrak pays the infrastructure owner for its use. As a result, Amtrak relies on freight railroad maintenance and system support to deliver quality, timely service.

Including the commuter railroads that operate on the NEC, there are approximately 750,000 passenger trips on the NEC each day and the corridor accounts for over half of Amtrak's daily ridership. The NEC is the busiest railroad in North America with approximately 2,200 trains operating over some portion of its network every day. It is highly capacity-constrained, creating service challenges for both Amtrak as well as commuter and freight railroads that operate on the corridor. Capacity is generally sufficient in other parts of Amtrak's network, with states supporting service expansions particularly on the West Coast and the connections to the NEC. Recently there has been a renewed national interest in expanding passenger rail service. High-speed passenger rail project planning is underway in several areas, including California, Florida, the Chicago area, and Texas.

While safe to operate, much of the NEC's infrastructure is beyond its useful life, increasing maintenance costs and reducing system reliability. The average age of major NEC backlog projects is 111 years old, including 10 moveable bridges, three sets of tunnels, and one viaduct. Upgrades and repairs to basic infrastructure items like signals, power systems, and tracks, as well as service improvement projects to add capacity, are needed to meet growth in the northeastern economy and related travel demand. NEC. This loan will allow Amtrak to add capacity and improve service along the NEC, but will not solve the large and growing backlog of capital needs.

PUBLIC SAFETY, RESILIENCE & INNOVATION

Rail accidents and derailments are down nearly 50% over the last decade. Railroads have been reconfiguring highway-rail crossings to separate the two and improve safety. While fewer people are being killed or sustaining injuries in highway-rail crossing incidents, 237 people were killed and 991 people were injured in 2015. To further improve safety and reduce accidents associated with operator error, like the 2015 Amtrak derailment in Philadelphia which cost eight lives, the federal government has required the installation of positive train control (PTC) by 2018. PTC is a signal technology designed to prevent collisions and ensure safe operating speeds and will be required for all lines carrying passengers.

Rail resilience is often tested by extreme weather events, which degrade infrastructure and lead to delays as well as concerns about continuing availability of service. Super Storm Sandy demonstrated the need to address resiliency, as key tunnels under the East River and Hudson River were severely damaged.

Railroads have adapted new technologies to monitor the health of the rails and target problem areas for maintenance. Innovations include infrastructure condition data collection and processing tools, such as track geometry cars that travel over the rails looking for defects. Technology includes onboard tools that check the alignment of the track and acoustic and heat sensors that monitor passing trains for potential issues. These technologies help detect problems early and prevent derailments, and early results suggest such monitoring prevented more than 1,000 service interruptions in 2015.

RECOMMENDATIONS TO RAISE THE GRADE

- At the state and regional level, rail should be a part of multimodal strategic plans and capital investment programs that supports a role for both freight and passenger rail.
- Support a regulatory and financial environment that encourages continued private investment in the nation's freight railroad system.
- Use innovative financing methods like revenue bonds and tax exempt financing at the state and local levels, public-private partnerships, and state infrastructure banks to increase funding for freight and passenger rail.
- Develop state-level short line assistance programs with low-interest loans and grants to modernize these rail lines to permit 286,000 pound loads and increase allowable speeds, continue the federal Railroad Track Maintenance Tax Credit.
- Establish a federal rail trust fund to fund rail improvements, including matching provisions to encourage participation by states as well as private companies.
- Improve passenger rail in dense corridor markets in a balanced investment program with air, bus, and automobile travel.

DEFINITIONS

Intermodal – The transfer of products involving multiple modes of transportation—truck, railroad, barge, or ship.

2017 INFRASTRUCTURE REPORT CARD

Double stack – The stacking of a shipping container on top of another container. To allow of double stack containers on a route, railroads frequently need to raise bridge and tunnel clearances.

Positive Train Control – A signaling system designed to determine a train's location, direction and speed and use that data to prevent: train-to-train collisions; derailments caused by excessive speed; unauthorized incursions by trains onto sections of track where maintenance activities are taking place; and movement of a train through a track switch left in the wrong positions.
