The 2019 Report Card for Puerto Rico’s Infrastructure gave the Commonwealth of Puerto Rico an overall GPA of D-. The good news is there are solutions to all of these challenges, and we can raise Puerto Rico’s infrastructure grades. Included below are four suggestions that can be applied to all of Puerto Rico’s infrastructure, and the full Report Card provides additional recommendations to improve each specific infrastructure category. By learning more today about the conditions of the infrastructure you use every day, you too can help raise the grade.

1. **Increase the resiliency of Puerto Rico’s infrastructure.** Our future depends on the ability of our infrastructure to not only protect us against increasingly severe storms, but to facilitate timely emergency management, repairs, and recovery efforts after a major event. The reliability of all our critical networks can be improved by requiring the Central Government, municipalities, and industry to build to ASCE standards, incorporating lifecycle cost analysis into projects, and by maintaining our existing assets. Taking these actions will extend the useful life of our assets and decrease costs in the long-term.

2. **Establish a Puerto Rico Infrastructure Plan with a wide variety of stakeholders and experts on the field.** Infrastructure development is a long-term endeavor with significant impacts on economic growth and competitiveness. Puerto Rico should formulate a general Infrastructure Plan with clear priorities and strategies to achieve them. This plan should be approved by the Legislative Assembly, but be developed with limited political interference.

3. **Puerto Rico’s infrastructure systems need comprehensive and consistent maintenance programs and databases.** A lack of programmed funding for the comprehensive maintenance of our existing roads, bridges, energy, dams and other critical networks has severely impacted the lifespan of these assets. Developing comprehensive asset management databases is a critical first step, as these databases can help determine total funding and maintenance needs. Looking ahead, infrastructure planning, design, and constructing should take into account the total cost of operating an asset over its lifespan. Resilience and sustainability must be factors in determining lifecycle costs. Lessons learned, unique Puerto Rico characteristics, and climate change should also be considered.

4. **Improve and increase the technical expertise at agencies that own and operate infrastructure so that they can complete regulatory requirements.** Many of Puerto Rico’s agencies have too few technical experts to operate the infrastructure in accordance with regulations and customer expectations. Additionally, institutional knowledge is not codified in the agency, but instead may be lost when individuals retire or resign. We need to improve the continuity of the workforce training to operate and maintain our roads, dams, solid waste, drinking, and wastewater infrastructure.

**About the Grades**

Infrastructure is graded based on eight criteria: capacity, condition, funding, future need, operation and maintenance, public safety, resilience, and innovation. ASCE grades on the following scale and defines these grades as:

- **A** Exceptional, Fit for the Future
- **B** Good, Adequate for Now
- **C** Mediocre, Requires Attention
- **D** Poor, At Risk
- **F** Failing/Critical, Unfit for Purpose

**About the ASCE Puerto Rico Section**

The American Society of Civil Engineers (ASCE), founded in 1852, is the oldest national professional engineering society in the United States. ASCE represents more than 150,000 members of the civil engineering profession in 177 countries. The Puerto Rico Section is commemorating its 90th anniversary in 2019, with a focus on making Puerto Rico competitive, and improving Puerto Ricans quality of life.

**How You Can Get Involved**

1. **Get the full story behind this Report Card at**
   www.infrastructurereportcard.org/Puerto-Rico.
2. **Find out the condition of the infrastructure near you on the Save America’s Infrastructure app available on iTunes.**
3. **Ask your elected leaders what they’re doing to make sure your infrastructure is reliable for the future. Use your zip code to find your list of elected officials at**
   www.infrastructurereportcard.org/take-action.
The 2019 Report Card on Puerto Rico’s Infrastructure evaluates eight infrastructure categories. Of those eight, seven infrastructure categories are in poor or at risk condition and one is in failing or critical condition.

The good news is there are solutions to all these challenges, and we can raise Puerto Rico’s infrastructure grades. By learning more today about the condition of the infrastructure you use every day, you too can help raise the grade.

**2019 PUERTO RICO’S INFRASTRUCTURE REPORT CARD**

### BRIDGES
According to the Federal Highway Administration, there are 2,925 bridges in Puerto Rico. Of those bridges, 47 percent are in poor condition, and approximately 69 percent are in fair condition. Only 19 percent of Puerto Rico’s bridges are in good condition. Additionally, Puerto Rico’s population has declined by 14 percent since 2010, leaving a lack of access to financing, perpetuates challenges.

### DRINKING WATER
Public water systems serve approximately 96 percent of Puerto Rico’s 3.3 million residents, with the remainder served by rural and remote small community–operated systems. Puerto Rico Aqueduct and Sewer Authority (PRASA) owns and operates much of the complex infrastructure network and faces significant challenges. Approximately 59 percent of treated water ends up as non-revenue water loss, meaning the utility is providing it to customers at no charge through various mechanisms such as inaccurate meters, unauthorized water consumption, or water main leaks. It should be noted PRASA has improved its non-revenue water loss rate, which stood at 62 percent five years ago. While water quality continues to improve as new processes are implemented in response to stricter regulations and public expectations, hurricanes have aggravated an already difficult fiscal and operational situation for both PRASA and non-PRASA systems. PRASA will undertake a $2 billion capital improvement program over the next five years, with one-third of funding allocated to repair damage and a significant amount set aside for resiliency.

### ENERGY
Puerto Rico’s 37 dams maintain water levels in reservoirs and streams for a variety of purposes, including recreation, flood control, potable water storage, and hydropower. Ninety-seven percent of Puerto Rico’s dams are high-hazard potential, meaning failure would likely result in loss of life. Island-wide, all the high-hazard potential dams have emergency action plans (EAP) in place, although only 25 percent were exercised — i.e. tested — in the past five years. While 81 percent of dams in Puerto Rico are reported to be in satisfactory condition, the state dam safety office lacks the funding to comprehensively seize and hydraulic studies and other analysis that is needed to more thoroughly define the current conditions, risks, and necessary retrofits of the dams. Additionally, dams owners require funding to perform retrofits deemed necessary if discovered during those inspections. Meanwhile, sedimentation poses a long-term threat and impacts the ability of dams to store enough water to serve residents during dry seasons. Several of the most important water supply reservoirs have lost between 30 percent and 60 percent of their capacity due to sedimentation. With a large number of dams aged 50 years or more and predicted increases in flooding, additional funding is required to mitigate the risk of dam failure, especially for dams within the North Coast water supply network.

### PORTS
Puerto Rico, an island in the Caribbean, is highly dependent on maritime transportation to import most of its supplies. This makes ports infrastructure a critical. Ninety-eight percent of the island’s electricity comes from imported petroleum, natural gas, and coal. Approximately 80 percent of the island’s food is currently imported. Ports also play an important role in the tourism industry; FY2018 closed with a total of approximately 1.2 million cruise ship visitors and an approximate contribution of $152 million to the economy. The importance of ports was especially noticeable after Hurricane Maria hit the island in September 2017, since they played a critical role in the delivery of first aid supplies. Puerto Rico’s already fragile ports infrastructure suffered severe damage as a result of the hurricane. The estimated cost to repair all ports throughout the island is over $750 million. However, the capital improvement program for FY2020-2024 provides just over $2 million in investments.

### SOLID WASTE
Puerto Rico’s solid waste infrastructure is under significant strain. Post-closure activities at the 30 landfills that were closed in the 1990s are not taking place. Meanwhile, of the 29 solid waste facilities currently in operation, only 11 are compliant with federal standards. Insufficient operation practices, management, and inspection of both open and closed municipal solid waste facilities often fail to improve waste compaction and ineffective leachate and stormwater management. Consequently, this contributes to the presence of vectors at landfills, such as mosquitos, rats, and seasonal pests, which can potentially aid the spread of zika, chikungunya, and other diseases. Capacity at existing landfills is also an urgent concern, especially after Hurricanes Irma and Maria produced approximately 2.5 million tons of debris, or 2.5 to 3 years’ worth of solid waste that was then disposed of at landfills. The U.S. Environmental Protection Agency found in 2018 that there is less than five years of remaining capacity at active landfills across the island. Meanwhile, Puerto Rico residents on average dispose of 5.56 pounds of solid waste per person, each day, compared with the 4.4 pounds per person a day in the mainland U.S. Recycling rates on the island are low, with approximately 9 to 14 percent of solid waste diverted.

Puerto Rico’s residents and businesses largely depend on the Puerto Rico Aqueduct and Sewer Authority (PRASA) to provide wastewater collection services. PRASA owns and operates 51 wastewater treatment plants, 5,300 miles of sewer lines, and 824 wastewater pumping stations. While PRASA has implemented new processes in response to two Consent Decree Agreements with the Environmental Protection Agency, the agency still faces significant fiscal and operational challenges, especially in the aftermath of Hurricanes Irma and Maria. The island population has declined by 14 percent since 2010, leaving fewer rate payers to fund necessary projects. The declining rate payer base, combined with a lack of access to financing, perpetuates challenges associated with funding PRASA’s capital investment program. A total of $550 million is needed for renewal and replacement over the next six years to update aging PRASA infrastructure. A recent restructuring of approximately $3 billion debt is expected to provide payment savings of $440 million over five years, that funding will be provided to the stalled capital improvement programs.

Puerto Rico’s already fragile ports infrastructure suffered severe damage as a result of the hurricane. The estimated cost to repair all ports throughout the island is over $750 million. However, the capital improvement program for FY2020-2024 provides just over $2 million in investments.

Puerto Rico’s energy infrastructure is in poor condition. The island also lacked source diversity; approximately 98 percent of electricity was generated by fossil fuels. Still, average electricity prices exceed $0.99/kWh, roughly double the U.S. average. Aftermath of the energy grid and contributed to the second-longest blackout in recorded history, authorities focused their efforts on the short-term goal of restoring power as quickly as possible. However, the long-term need for developing a resilient and sustainable energy grid was overlooked. Today’s network is fragile, blackouts are frequent, and prices have continued to increase. Meanwhile, the financial situation of Puerto Rico’s electric Power Authority lacks access to capital to improve grid condition, capacity, and resilience, making federal support imperative.

Puerto Rico Aqueduct and Sewer Authority (PRASA) to provide wastewater collection services. PRASA owns and operates 51 wastewater treatment plants, 5,300 miles of sewer lines, and 824 wastewater pumping stations. While PRASA has implemented new processes in response to two Consent Decree Agreements with the Environmental Protection Agency, the agency still faces significant fiscal and operational challenges, especially in the aftermath of Hurricanes Irma and Maria. The island population has declined by 14 percent since 2010, leaving fewer rate payers to fund necessary projects. The declining rate payer base, combined with a lack of access to financing, perpetuates challenges associated with funding PRASA’s capital investment program. A total of $550 million is needed for renewal and replacement over the next six years to update aging PRASA infrastructure. A recent restructuring of approximately $3 billion debt is expected to provide payment savings of $440 million over five years, that funding will be provided to the stalled capital improvement programs.

Puerto Rico has struggled in recent years to adequately maintain its roadway network, in part because of a reduction in personnel and partially due to a lack of dedicated funding for road preservation and maintenance. The lack of a data-driven asset management plan also hurts long-term road management policies and projects. Additionally, the island allows much heavier trucks on its roadways than much of the mainland U.S., which leads to quicker degradation of pavement and bridges. Making matters worse, often Puerto Rico’s local municipal roads are built without the necessary supervision or quality control standards, which lead to early pavement failure. Pavement maintenance and resurfacing actions on local municipal roads could be substantially improved by promoting quality control standards and providing appropriate project supervision and management. Puerto Rico is currently restructuring its debt through Title III protections under PROMESA, which has allowed the Puerto Rico Highway and Transportation Authority (PRHTA) to direct its resources to improvement projects on state roads. However, in order to maintain its assets in a state of good repair and continue normal operations, PRHTA estimates that it will need $3.1 billion of capital expenditures from FY18 to FY22. Additionally, funding from the federal government and a more strategic approach to maintenance is necessary in the near-term.

Puerto Rico Aqueduct and Sewer Authority (PRASA) to provide wastewater collection services. PRASA owns and operates 51 wastewater treatment plants, 5,300 miles of sewer lines, and 824 wastewater pumping stations. While PRASA has implemented new processes in response to two Consent Decree Agreements with the Environmental Protection Agency, the agency still faces significant fiscal and operational challenges, especially in the aftermath of Hurricanes Irma and Maria. The island population has declined by 14 percent since 2010, leaving fewer rate payers to fund necessary projects. The declining rate payer base, combined with a lack of access to financing, perpetuates challenges associated with funding PRASA’s capital investment program. A total of $550 million is needed for renewal and replacement over the next six years to update aging PRASA infrastructure. A recent restructuring of approximately $3 billion debt is expected to provide payment savings of $440 million over five years, that funding will be provided to the stalled capital improvement programs.
